## I. TECHNICAL DATA

TRACK SYSTEM	4 Track 2 Channel Stereo System
REEL CAPACITY	Up to 10-1/2" reel
HEADS	Erase head × 1 GX recording head × 1 GX playback head × 1
MOTORS	AC servo motor for capstan drive × 1 AC eddy current motors for reel drive × 2
TAPE SPEED	19 cm/s ± 0.8% (7-1/2 ips.) 9.5 cm/s ± 1.0% (3-3/4 ips.) Pitch control: more than ± 6%
WOW & FLUTTER	Less than 0.03% WRMS, 0.08% DIN 45500 at 19 cm/s Less than 0.04% WRMS, 0.10% DIN 45500 at 9.5 cm/s
TAPE WINDING TIME	130 sec. using 740 m (2400 ft.) Tape
FREQUENCY RESPONSE	30 to 26000 Hz ± 3 dB at 19 cm/s 30 to 19000 Hz ± 3 dB at 9.5 cm/s
SIGNAL TO NOISE RATIO	Better than 62 dB at 19 cm/s DIN 45500 Better than 60 dB at 9.5 cm/s DIN 45500
HARMONIC DISTORTION	Less than 0.5%
INPUT	MIC: 0.25 mV (input impedance 2.4 kohms) Required microphone impedance: 600 ohms Line: 70 mV (input impedance 100 kohms)
OUTPUT	Line: 775 mV at 0 VU Required load impedance: more than 20 kohms Phone: 100 mV/8 ohms at 0 VU
DIN	Input: 2 mV (input impedance: 10 kohms) Output: 755 mV Required load impedance: more than 20 kohms
DIMENSIONS	440 (W) × 446 (H) × 241 (D) mm (17.3 × 17.6 × 9.5")
WEIGHT	17.6 kg (38.9 lbs)
POWER REQUIREMENTS	100V 50/60 Hz for Japan 120V 60 Hz for US & Canada 220V/240V switchable, 50 Hz for European countries & Australia 110/120/220/240V 50/60 Hz, switchable for other countries
POWER CONSUMPTION	JPN 80 W CSA, AAL 150 W U/T 150 W

\* For improvement purpose, specifications and design are subject to change without notice.

## II. DISMANTLING OF UNIT

In case of trouble, etc. necessitating dismantling, please dismantle in the order shown in the photographs. Reassemble in reverse order.

### III. CONTROLS

## V. VOLTAGE AND CYCLE CONVERSION

(a) CEE, UK, SAA Model

(b) U/T Model

### 1. VOLTAGE CONVERSION (Refer to Fig. 4)

- 1) JPN Model (100V, 50/60 Hz)  
CSA, AAL Model (120V, 60Hz)  
Voltage can not be switched.
- 2) CEE, UK Model (220V/240V, 50Hz)  
A voltage selector switch is provided under the AC inlet on the back side of machine. Select the proper voltage with this switch according to the voltage to be used. Move the switch to the left side for 220V and to the right side for 240V.
- 3) U/T Model (110V/120V/220V/240V, 50/60 Hz)  
Remove the back board and look for the voltage selector on the upper right portion of the machine. Change the position of voltage selector plugs so that the voltage to be used coincides with the voltage shown through the opening of voltage selector plug. Fuse change is not necessary.

Fig. 4 Voltage Conversion

Fig. 5 Cycle Conversion (U/T, JPN Model)

## 2. CYCLE CONVERSION (Refer to Fig. 5)

Cycle can be converted only in U/T, JPN Model. Remove the back board and select the position of switch located in the recess at right portion of Power Supply & Sys. Con P.C Board to correspond to the frequency of power to be used. Move the switch to the right for 50 Hz and to the left for the 60 Hz.

**CAUTION:** When selecting the voltage or cycle, turn off the power and disconnect the power cord.

# VI. CIRCUIT OPERATING PRINCIPALES

## 1. CIRCUIT CONSTRUCTION OF LM8529

### 1) Diagram showing pin position

Fig. 6

### 2) Display Board

Fig. 7

### 3) Theoretical Functioning

#### a. UP/DOWN (input)

“H” for counting up.

“L” (or open) for countdown.

#### b. TAPE PULSE (input)

Displays 0 to 9999 or 0 to 5959 according to the counting pulse.

When 1 or 5 pulses are added to the TAPE PULSE input the display will show changes of  $\pm 1$  only. There is a built in 5  $\mu$ sec chattering prevention circuit in this terminal.

#### c. DIRECT (input)

When 5 pulses are input into the TAPE PULSE terminal and this terminal is set to “L” or open, the display will change by +1 or -1.

When 1 pulse is input into the TAPE PULSE terminal and this terminal is set to “H”, the display will change by +1 or -1.

#### d. SIX/DECADE

The counter becomes decade when this terminal is “L” (or open) and the display can show from 0 to 9999 according to the counting pulse.

The counter becomes a sixtieth counter when this terminal is “H” and the display can show from 0 to 5959 according to the counting pulse.

#### e. ALL ZERO COUNTER DETECTION (OUT 1 output)

At the moment when the counter changes from 1 to 0, the output driver OUT 1 goes ON within about 200 to 400 msecs, ie: OUT 1 becomes “H”.

#### f. MEMORY STOP DETECTION (OUT 1 output)

At the moment when the MEMORY INPUT terminal changes from “L” to “H”, the contents

of the tape counter (N) are memorized. After the tape counter has counted up  $N+1, N+2 \dots N+k$ , it counts down  $N+k-1 \dots N+1$  and at the moment that the counter reaches the memorized value (N), OUT 1 output goes on within about 200 to 400 msecs, ie: OUT 1 becomes “H”. Also when countdown begins, at the moment when the counter changes from 1 to 0, OUT 1 output goes on within about 200 to 400 msecs, ie: OUT 1 becomes “H”. Further when counting up 0, 1, 2,  $\dots N-2, N-1$ , at the moment when the counter reaches the memorized value (N) OUT 1 output goes on within about 200 to 400 msecs, ie: OUT 1 becomes “H”. However if the memory terminal is “L”, OUT 1 goes off, ie: OUT 1 remains “L”.

g. Item f applies when the memory terminal is “H”.

#### h. OUT 1 output

Output terminal generating the signal detecting counting pulse zero, all zero counter and memory stop, and the generated pulse is “H” within about 200 to 400 msecs.

#### i. STW/TAPE input

If this terminal is “H”, counter will display the stop watch and if at “L” will display the tape counter.

#### j. RESET input

With i’s STW/TAPE terminal at “H” the stop watch counter will be reset to zero when this terminal is also put to “H”. With i’s STW/TAPE terminal at “L” (open) the tape counter will be reset to zero when this terminal is put to “H”. This reset terminal becomes open and “L”.

#### k. Initial clear circuitry: Counter resetting with power on.

This is a reset circuit to initialize the tape counter and stop watch counter inner LSI at the moment when voltage is added to the LSI. At the initial condition the counter will always be 0.

#### l. BLANKING input

All the segments’ output can be made “L” by making this BLANKING terminal “L”.

#### m. START/STOP input

When the START/STOP terminal is put to “H”, the display will go up 1 per second.

When at “L”, the display will stop at +1.

There is an inbuilt 15 to 30 msecs chattering prevention circuit in this terminal.

#### n. AC IN input

The commercial frequency (50, 60 Hz) is added to this terminal as the standard frequency for the stop watch. There is a built-in hysteresis circuit in this terminal.

#### o. f SELECT input

When 50 Hz is added to n’s input terminal, the frequency selection terminal is set to “H” and when 60 Hz is added, is set to “L”

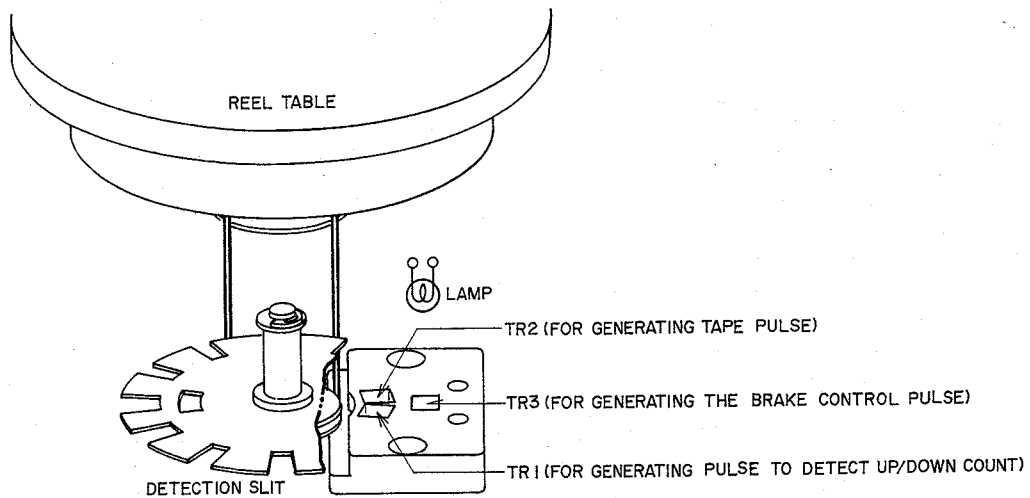

Fig. 8

## 2. PULSE GENERATING MECHANISM

In the GX-625, the pulse for the tape counter and the pulse for braking control during auto system are both generated by reel revolution. As in Fig. 8 a photo transistor is positioned under the detection slit and is lit by a lamp above. When this detection slit is turned by the reel table the photo transistor goes ON and OFF and the pulses are generated.

## 3. TAPE COUNTER OPERATION

As the reel turns, TR1 and TR2 go on and off repeatedly and pulses are generated. The pulse generated by TR1 is added to the UP/DOWN input terminal of COUNTER LSI LM8529. This is the pulse which decides whether there is to be count up or count down. The pulse generated by TR2 is added to the COUNTER LSI's Tape Pulse input but if added

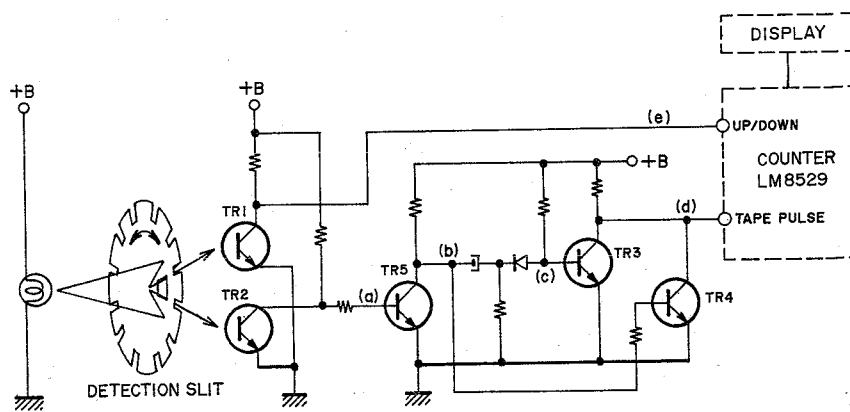

Fig. 9

as it stands, it will be unable to detect correctly whether it is counting up or down when the tape counter is counting single pulses from the first initial position (When the detection slit is stopped). To prevent this, the pulse width and phase are changed by TR5 and TR3. The characteristics of these waveform changing circuits are decided by the installation position of the photo transistors TR1 and TR2.

If we explain the circuitry's operation, the pulse generated by the photo transistor TR2 is reversed by TR5 and differentiated by CR. Only the negative pulses of the diode differentiated pulses are added to TR3's base.

In TR3's collector, the pulse generated by TR2 and the raised section are the same but a pulse with a narrowed positive pulse width is generated.

TR4 cuts the fear of ripple being generated by the raised section of TR2's pulse and prevents miscounting.

#### 4. THE SELECTION OF COUNT UP/COUNT DOWN

As in Fig. 10, pulse is added to the UP/DOWN terminal and TAPE PULSE terminals of COUNTER LSI. This counter counts up when the UP/DOWN is "H" and the TAPE PULSE terminal is raised to "H". It counts down when the UP/DOWN terminal is "L" and the TAPE PULSE terminal is raised to "H". Therefore, regardless of the UP/DOWN terminal's

position, it will decide to count up or count down if the TAPE PULSE terminal is raised to "H".

Fig. 10

#### 5. SERVO BRAKING DURING AUTO PLAY

It is essential to stop tape run completely when the tape counter reaches "0" from RWD mode in either auto stop, auto play or auto repeat. As open reel tapes have higher inertia the tape must be slowed down from high speed revolution before stopping at a designated point. In the GX-625 there are two braking points with 10" reels at "29" and "9" and one with 7" reels at "9" on the tape counter.

#### DETECTING THE BRAKING POINTS (29, 9, 0)

As anode common LEDs are used, the lighted LEDs' cathode side is L and the unlighted cathode side is H.

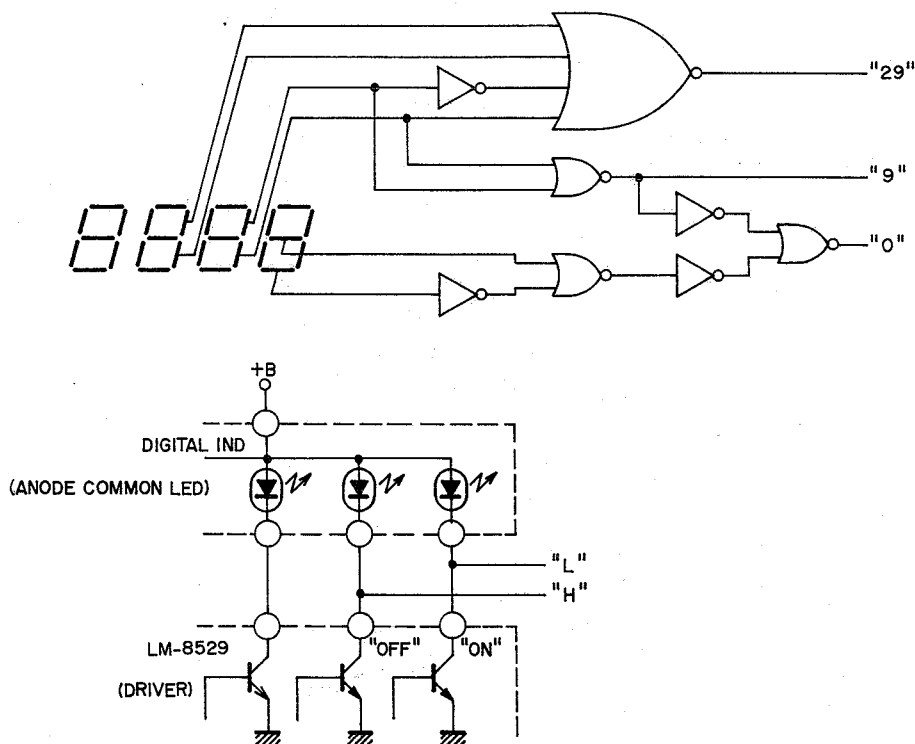

Fig. 11

Fig. 12

## 6. REEL DRIVE CIRCUITRY FOR BRAKE CONTROL

### 1) JK Flip Flop

Fig. 13

As shown in the diagram, when terminals J and K are kept at "H" they work in the same way as T flip flop, and as input pulse enters terminal C, the output of Q and  $\bar{Q}$  are reversed in turn. When the RESET terminal is "H" Q = "L" and  $\bar{Q}$  = "H" with absolutely no relationship to J, K or C terminals.

### 2) Reel Drive

The number 6 terminal of IC7 will be "H" if either the auto stop, auto play or repeat switches are on. Terminal number 5 becomes "H" in the RWD mode. Therefore the output at terminal 4 will be "H" and TR17 is ON so the reset terminal of IC3-b becomes "L". In RWD mode or when the Auto system switch is not depressed, IC3-a/b has been reset to Q terminal is "L".

At this point when the pulse is input from the tape counter which is at "29", terminal Q reverses and becomes "H". As a result, TR15 and TR16 go ON and relay RL1 is activated. However this explanation applies to 10" reels only. With 7" reels, the Q output passes the reel size selector and as it is dropped to earth the relay is not activated.

When the pulse from the tape counter at "9" is input, IC3-b's Q output is reversed, becoming "H" and relay RL1 is activated by TR13 and TR14.

## 7. FIXING THE AMOUNT OF BRAKING (DETERMINING THE NO. OF REEL REVOLUTIONS)

Pulse is generated in TR3's collector by the revolution of the detection slit. TR21 is turned ON and OFF repeatedly by this pulse. The pulse from TR21's collector and emitter is rectified and added to TR22's gate.

The voltage added to this gate changes according to the number of pulses from TR3 or in other words, the number of reel revolutions.

Consequently the voltage flowing between TR22's drain and source also changes, so when the number of revolutions does not reach the fixed figure TR23 does not go ON. It is VR1 5 k $\Omega$  which determines the number of reel revolutions turning TR23 ON. Thus it is this volume which determines by operating the brake how low the number of reel revolutions should drop. This volume also fixes the number of reel revolutions after the brake is activated at "29" on the tape counter. The number of revolutions from "9" on the tape counter is lower than after "29" and this is fixed by putting TR25 and TR26 ON and adding bias to TR22's gate. With a 7" reel, the number of revolutions from "9" on the tape counter is fixed at a lower figure than "29" but higher than "9" on the tape counter with 10" reels by TR24 adding bias to TR22's gate.

Fig. 14 When the no. of reel revolutions is high

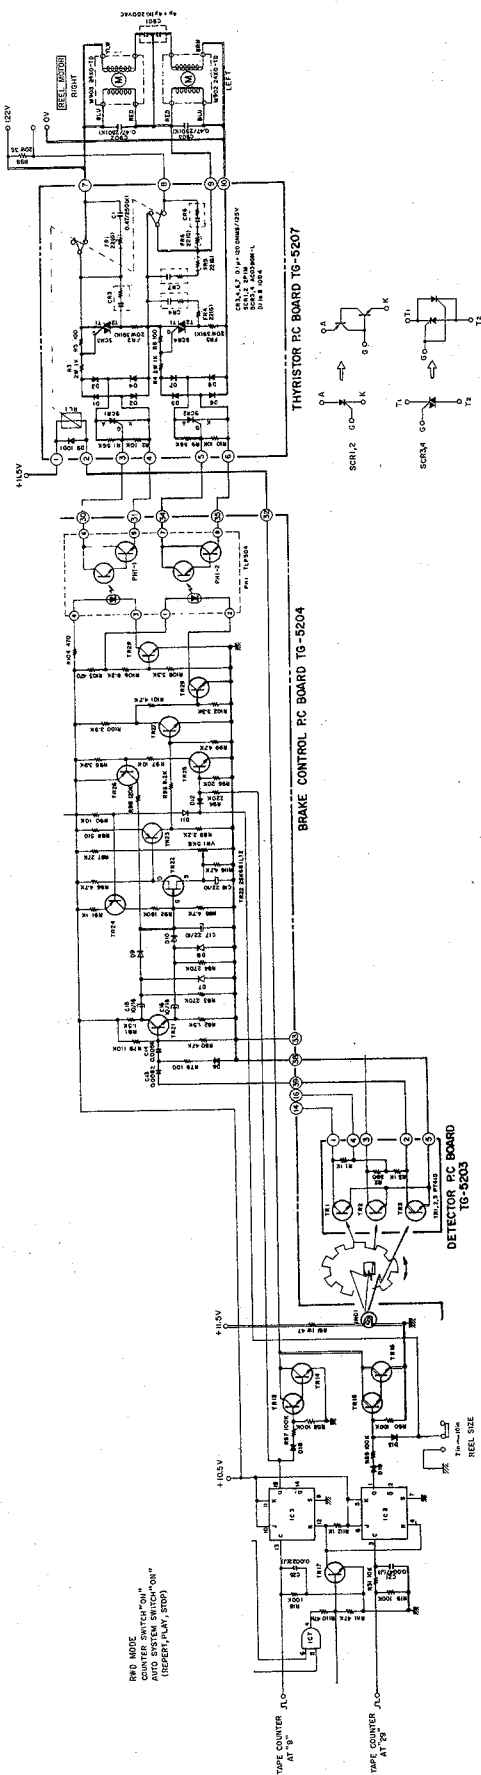

Fig. 15 When the no. of reel revolutions is low

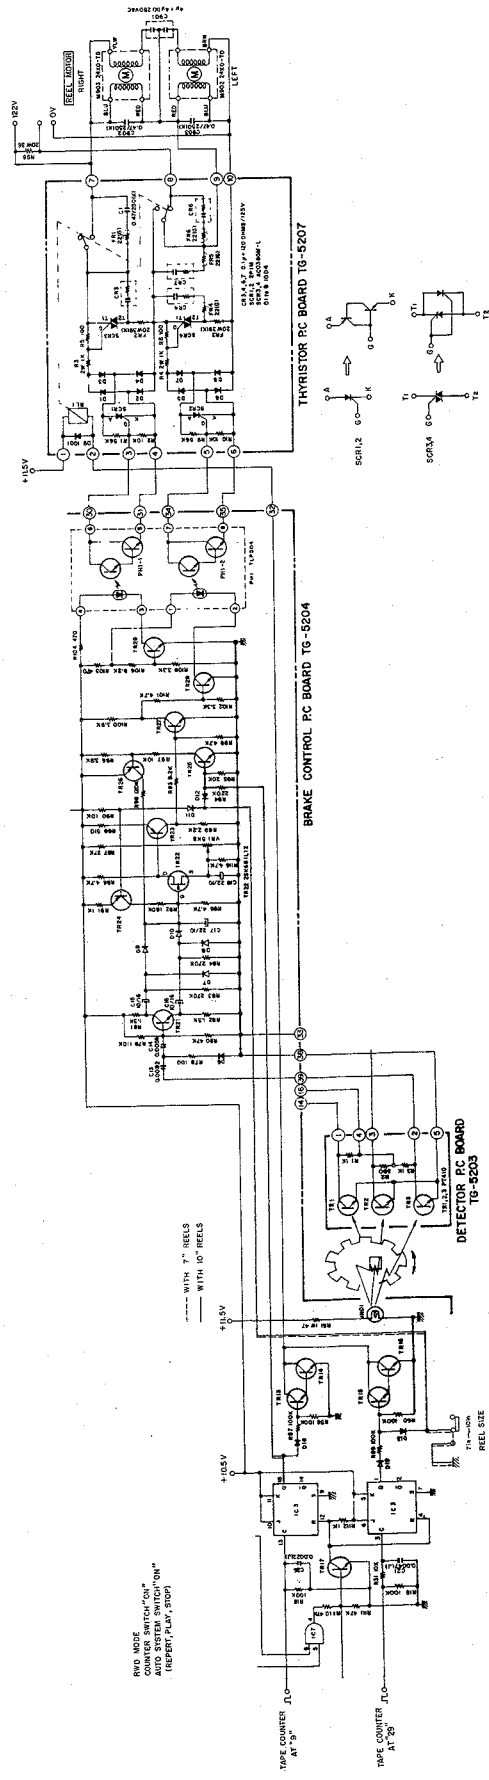

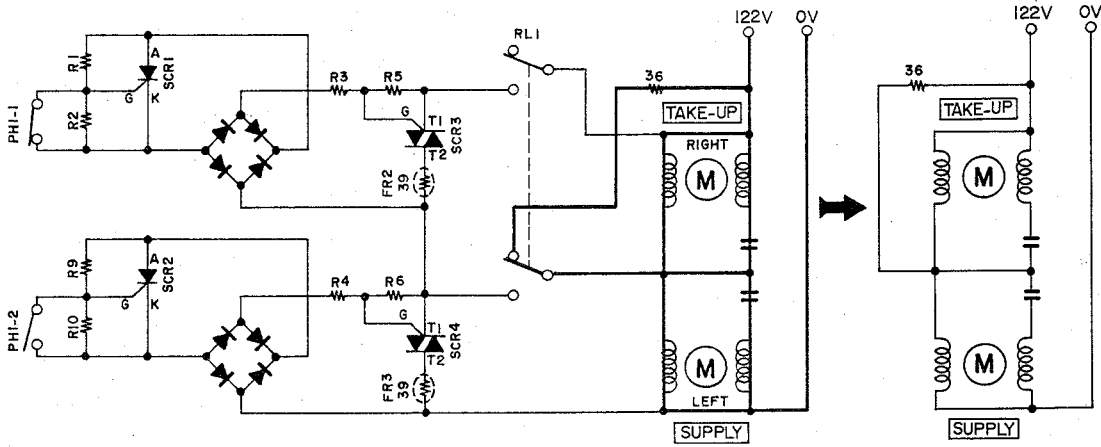

Fig. 16 Fixed no. of revolutions from tape counter at "9"

## 8. BRAKE OPERATION

(a) RWD mode

(b) Braking from RWD mode (When fixed number of revolutions is exceeded.)

(c) After the reel has begun revolving (Just after the RWD button is depressed.)  
Or when the number of revolutions is lower than the fixed number due to braking.

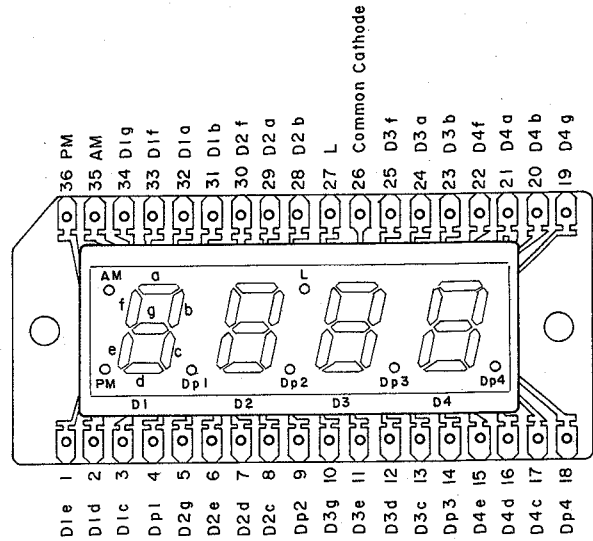

Fig. 17

When the deck is put into RWD, the voltage added to both motor terminals is low and the force of revolution weakens because the resistor of 36 ohms parallel to the take up reel motor is connected. On the other hand the voltage to the supply reel motor is high and the force of reel revolution is strong. Therefore the tape is wound onto the supply reel. (Fig. 17-(a)). As the reel is revolving faster, PH1-1 goes ON and PH1-2 goes OFF. At this point the pulse from the tape counter, when it is at "29" or "9", enters and relay RL1 is activated. The current passes through RL1 and flows as shown by the red line in Fig. 17-(b). SCR1 goes OFF as the electric potential difference between the gate and the cathode disappears as PH1-1 goes ON, and it stays OFF because no voltage to switch on is added to SCR3's gate.

SCR2 goes ON because electric potential difference is created between its gate and cathode by a flow of current to R10. By putting SCR2 ON, large current flows to R4, bias is added to SCR4's gate with the result that SCR4 goes ON. From the above operation, the circuitry on the left ahdn side of Fig. 17-(b) can be written as the right hand side. This is seen in the fact that high voltage has been added to the take up reel motor and the voltage to both terminals of the supply reel motor has been lowered by FR3 39 ohms. In other words, a state the same as FF has been momentarily created during RWD and by adding force in the opposite direction to the direction of reel revolution the number of reel revolutions can be decreased.

Due to the same operation, when the number of reel revolutions is lower than designated, it goes into RWD because PH1-1 and PH1-2's ON and OFF are reversed. In this way, repeating the RWD and braking operations according to the number of reel revolutions, the number can be maintained to stop at any time and the brake will go on and tape run be stopped by the pulse from the tape counter when it is at "0".

## 9. DIGITAL INDICATOR (SL-1476-04W)

## 10. CIRCUIT CONSTRUCTION OF M54410P

This logic IC has been developed for an operation key that will maintain a HIGH output level by even a momentary low level in the desired input terminal.

### 1) Block Diagram

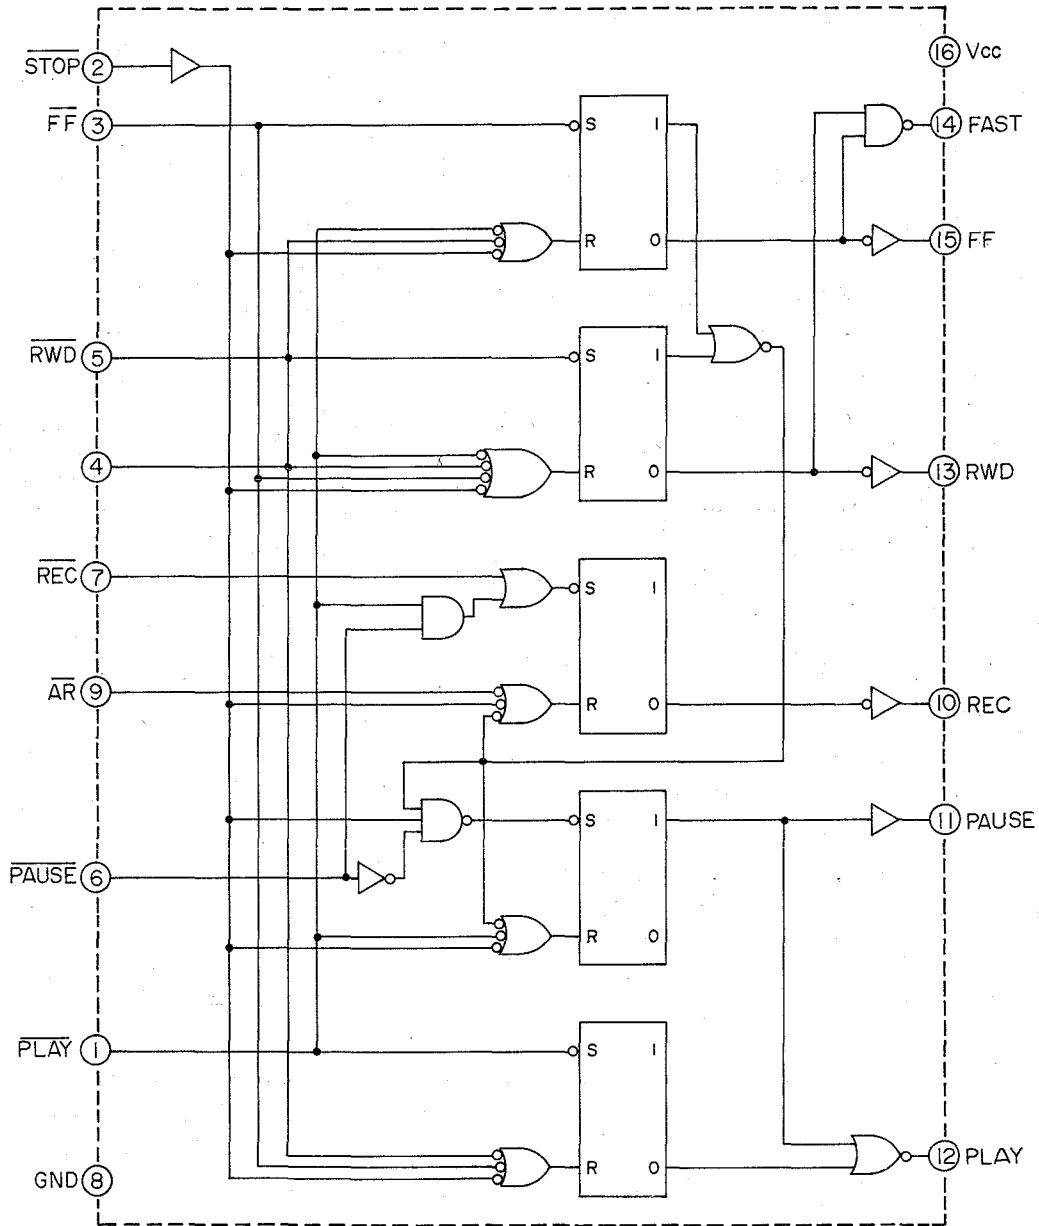

Fig. 18

## 2) Terminals and their functions

	Terminal Name	Terminal Function
Operation input terminals	$\overline{\text{STOP}}$	Input terminal for stopping operation
	$\overline{\text{FF}}$	Input terminal for fast forward
	$\overline{\text{RWD}}$	Input terminal for rewind
	$\overline{\text{REC}}$	Input terminal for recording
	$\overline{\text{PAUSE}}$	Input terminal for pause
	$\overline{\text{PLAY}}$	Input terminal for playback
Control input terminal $\overline{\text{AR}}$		Input terminal for preventing recording
Output terminals	FAST	Terminal with "H" signal output during fast forward or rewind mode
	FF	Terminal with "H" signal output during fast forward mode
	RWD	Terminal with "H" signal output during rewind mode
	REC	Terminal with "H" signal output during REC/PLAY or REC/PAUSE mode
	PAUSE	Terminal with "H" signal output during pause mode
	PLAY	Terminal with "H" signal output during playback mode

Chart-1

## 3) Operation activated by each input

Input Signal	Output						Output Mode
	FAST	FF	RWD	REC	PAUSE	PLAY	
$\overline{\text{STOP}}$	L	L	L	L	L	L	STOP Mode
$\overline{\text{FF}}$	H	H	L	L	L	L	FF Mode
$\overline{\text{RWD}}$	H	L	H	L	L	L	RWD Mode
$\overline{\text{PLAY}}$	L	L	L	L	L	H	PLAY Mode
$\overline{\text{PAUSE}}$	L	L	L	L	H	L	PAUSE Mode
$\overline{\text{REC/PLAY}}$	L	L	L	H	L	H	REC/PLAY Mode
$\overline{\text{REC/PAUSE}}$	L	L	L	H	H	L	REC/PAUSE Mode

Chart-2

- NOTES:**
1. The input signal is activated by the fall of .
  2. The output is maintained until the next input signal.
  3.  $\overline{\text{AR}}$  is a control input terminal and the REC output is not "H" when  $\overline{\text{AR}} = \text{"L"}$ .
  4. When  $\overline{\text{AR}} = \text{"L"}$  signal is supplied during the REC output is "H", REC output becomes "L".
  5. At the moment the power goes on, all output will be "L" and the Stop mode will be effected.

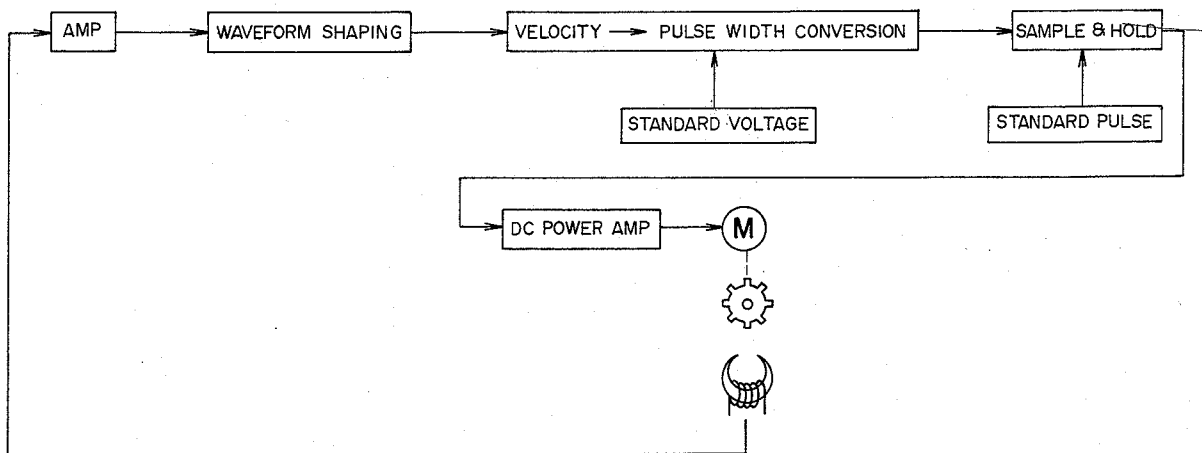

Fig. 19 Block Diagram

## 11. THE SAMPLE AND HOLD SYSTEM SERVO MOTOR (SCM-200) OPERATION

1) Servo signals generally created proportionate to the number of revolutions of the motor are shown either as frequency deviations or voltage deflections. The motor employed in GX-625 uses frequency deviation unaffected by time constants, etc., of the load circuit as input signal to the motor drive circuit through pulse width conversion.

This pulse width varies proportionately to the deviations in the number of motor rotations. The deviation is detected, converted to a voltage value, is held at that voltage until the next servo signal pulse, and then impressed into the motor drive circuit.

Meanwhile, since it requires a holding circuit and because 112 pulses are generated for each motor rotation, time constants of circuits coming before the Sample and Hold circuit can be greatly reduced compared to the conventional voltage deflection detection system.

For the reasons above, it features quick response to motor revolutions, minimum influence by temperature, and fewer chances of faulty mechanism. In addition, due to the inclusion of the servo voltage holding circuit, ripple content of the servo voltage has been sharply reduced to result in a smooth and stable tape transport with a minimum of wow & flutter.

### 2) Explanation of the circuit operation (Refer to Figs. 20, 21)

The velocity signal obtained from the motor's frequency generator is shaped into a waveform in the period of "T" proportionate to the velocity as

in (a) on collector TR6. This signal is differentiated and enters TR7 base. This makes TR7's collector output as in (c) and turns ON TR11 during the time of the negative pulse.

Meanwhile TR8 base is supplied with a waveform like (d) and when it reaches the threshold level. TR8 is turned on. A waveform (e) with pulse width " $t_1$ " is obtained from the collector. During the time "T" that TR8 is ON, TR10 base electric potential decreases to turn ON.

Consequently, TR9 base electric potential increases and TR9 is also turned ON for the time " $t_1$ ".

When the period "T" varies with the velocity, the pulse width " $t_1$ " varies according to TR8's threshold level. But when TR11 is on, it is constant due to the time constant. So that by using the period that TR11 is ON as the standard pulse, the pulse width " $t_2$ " is constant regardless of the velocity.

(g) and (h) show the ON and OFF condition of TR11 and TR9.

When the electric charge that was charged to C16 is discharged during the time TR9 is ON " $t_1$ ", a signal voltage of "e" proportionate to the velocity can be obtained. Next, with "e" as its basis, C16 is charged during the limited time of the standard pulse width " $t_2$ ", and by the charging voltage "e" the charging is stopped. The voltage is then held until the next standard pulse.

This voltage "e" is supplied to the TR12 base and a servo signal "E" is obtained. This servo signal "E" controls TR13 and drives the motor. As shown above, since " $t_1$ " and " $t_2$ " are small, servo signal ripples decreased and a near direct current servo signal is obtained.

In addition, the time constants of the smoothing circuit can also be decreased so that phase lag factor can be minimized.

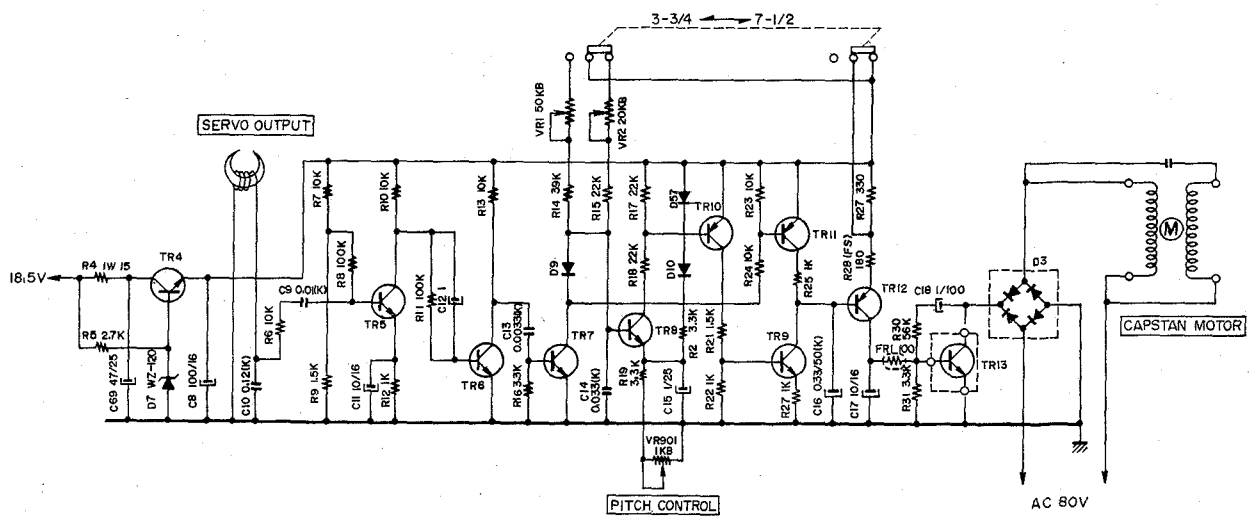

Fig. 20

Fig. 21

# VII. MECHANISM ADJUSTMENT

Fig. 22

Fig. 23

## 1. TAPE GUIDE HEIGHT ADJUSTMENT (Refer to Figs. 22, 23)

Adjust tape guide height so that the tape does not curl between the tape guide and guides on head base. As left and right tape guide height adjustment methods are different, be sure to refer to Figs. 22 and 23.

Fig. 24

## 2. REEL TABLE HEIGHT ADJUSTMENT

(Refer to Fig. 24)

- 1) Temporarily screw in the fixing screws leaving a gap of 15 mm between the reel table and the chassis board.
- 2) Run the tape and adjust the height of the reel table so that the tape is taken up in the center of the reel. Tighten fixing screws. Adjust the height of the right reel table at fast forward, of the left reel table at rewind.

Fig. 25

Fig. 26

## 3. CAPSTAN SHAFT LOOSEN PLAY

ADJUSTMENT (Refer to Fig. 25)

Adjust by turning Adjustment Screw to obtain a 0.1 to 0.2 mm degree of loose play when the capstan shaft is moved as indicated by the arrow mark. Tighten fixation nut to maintain optimum adjusted condition.

## 4. IMPEDANCE ROLLER LOOSE PLAY

ADJUSTMENT (Refer to Fig. 26)

Adjust Screws A and B so that impedance roller loose play is 0.1 mm. Confirm that the screws are tight following this adjustment.

Fig. 27

Fig. 29

Fig. 28

## 5. BRAKE BAND POSITION ADJUSTMENT AND BRAKE TENSION ADJUSTMENT

(Refer to Figs. 27 to 29)

- 1) Adjust the brake lever to 180° position by loosening the screws (a) and (a').
- 2) Work the brake plunger to check that the brake band is not slanted.
- 3) Adjust the position of the part with screws (b) and (b') to obtain a brake tension of  $550 \pm 50$  g on both brakes at stop mode.  
(Use a 1,000 g spring gauge for a reel with 60 mm diameter of tape.) In case the specified brake tension cannot be obtained, connect the springs to the other holes on the brake lever and adjust.
- 4) By working the brake plunger with a finger, adjust the position of the microswitch screw (c) so that the gap between the brake lever and the microswitch body is 0.5 to 1.0 mm.

Fig. 30

**6. PINCH ROLLER PLUNGER  
INSTALLATION POSITION AND PINCH  
ROLLER PRESSURE ADJUSTMENT**

(Refer to Fig. 30)

- 1) While in the play mode, adjust the position of pinch roller plunger by means of screw (a) until the gap (Fig. 30A) between P arm and the rubber part of stopper pin becomes 0.5 to 0.6 mm.
- 2) Connect a 2 kg spring gauge to the pinch roller fixing screw. Pull up the pinch roller and then let it slowly move back. Check that the spring gauge reads  $1.2 \text{ kg} \pm 100 \text{ g}$  at the moment the pinch roller touches the capstan and starts rolling. If the specified pressure cannot be obtained, adjust gap A by positioning the pinch roller plunger or replace the P spring, so as to attain the specified pressure.

Fig. 31

**7. PAUSE PLUNGER POSITION  
ADJUSTMENT (Refer to Figs. 30, 31)**

At the pause mode, the gap between the capstan and the pinch roller should be 0.5 mm. Adjust the pause plunger position with screws (b).

Fig. 32

## 8. TAPE SPEED ADJUSTMENT

(Refer to Fig. 32)

Set the Tape Speed Switch to 7-1/2 ips and playback the 1,000 Hz, 7-1/2 Test tape. Connect a frequency counter to LINE OUT and adjust VR2 20 kB until the counter reads 1,000 Hz  $\pm$  0.5%.

Next, set the Tape Speed Switch to 3-3/4 ips and adjust VR1 50 kB until the frequency counter reads 500 Hz  $\pm$  0.5%.

Fig. 33

## 9. SERVO BRAKE ADJUSTMENT

1) Tape run must stop completely at "0" on the tape counter from RWD when the AUTO SYSTEM (repeat, play and stop) is activated.

\* Tape RWD from a point below "9" on the tape counter can not be adjusted if it does not stop at "0" because the servo brake has not been activated.

2) Refer to VI item 7 for VR5.

3) Adjustment Method

- a. Put on a 10" reel and set the reel size selector to 10 in. (A reel with hole as used for turning the volume below may be used.)
- b. Depress the counter and auto system stop buttons.
- c. Reset the tape counter and fast forward to about "35".

d. Turn VR1 5 kB counter-clockwise 20° to 30° from its present position.

e. Put in the RWD mode. (Brakes at "29" and "9" on the tape counter and if this brake is too strong, tape run is reversed and goes into FF.)

f. While returning VR1 little by little in a clockwise direction, repeat RWD many times from "35" on the tape counter and set the volume where tape run does not reverse and stops at "0". The brake is too strong if the tape seems to stop momentarily even if it is not reversed.

g. Rewind from about "20", "35" and "100" on the tape counter and confirm that it completely stops at "0". There are differences caused by the amount of tape on the reels so please check in many positions.

h. Put on a 7" reel and check operation.

# VIII. HEAD ADJUSTMENT

Fig. 34

Fig. 35

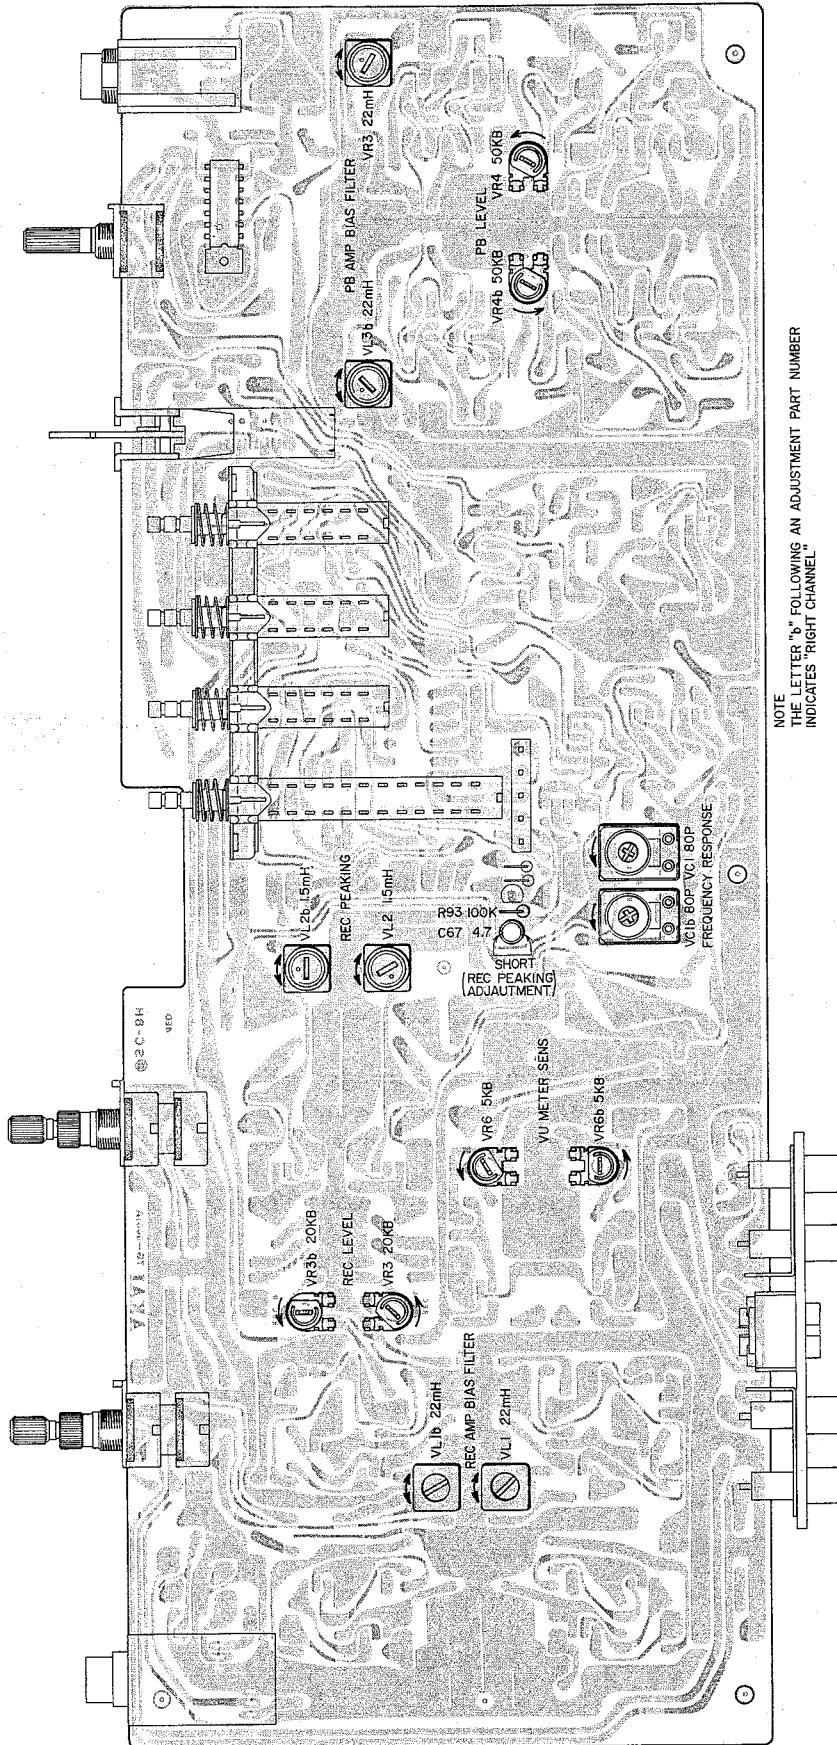

Step	Adjustment Item	Test Tape Supply Signal	Mode	Adjustment Point	Remarks
1	Tape Guide Height	Optional	Play	Tape Guide Height Adjustment Nut	Adjust so that tape travels smoothly and does not twist.
2	Erase Head Height	Optional	Play	(k) (l)	Upper edge of Left Ch. head core is 0.1 mm higher than upper edge of tape.
3	Recording Head Height	Optional	Play	(a) (b) (c)	Upper edges of Left Ch. head core and tape are the same height. (Refer to NOTE 6.)
4	Playback Head Height	Optional	Play	(d) (e) (f)	Upper edges of Left Ch. head core and tape are the same height. (Refer to NOTE 6.)
5	Playback Head Azimuth Alignment	8,000 Hz 3-3/4 ips Test Tape	Play	(f)	Maximum output, both channels.
6	Playback Head Angle Alignment	8,000 Hz 3-3/4 ips Test Tape	Play	(i) (j)	Adjust head gap surface so that there is no change in output level when tension is applied to the supply reel side.
7	Recording Head Azimuth Alignment	Scotch #176 Tape 15,000 Hz -20 dBm	REC	(c)	Maximum output, both channels.
8	Recording Head Angle Alignment	Scotch #176 Tape 15,000 Hz -20 dBm	REC	(g) (h)	Adjust head gap surface so that there is no change in output level when tension is applied to the supply reel side.

Chart-3

- NOTES:**
- As perfect head adjustments are vital to tape deck performance, be sure that these adjustments are carried out properly.
  - Be careful not to use a magnetized driver or other magnetized tools in the vicinity of the heads.
  - Use only new tape as level variation is likely to occur when using old tape.
  - Demagnetize heads with head demagnetizer before and after head adjustment.
  - Set tape speed to 7-1/2 ips.
  - Simultaneously adjust the front and back tilts of head until uniform contact is ensured between the tape and the surface of head.

# IX. AMPLIFIER ADJUSTMENT

NOTE  
THE LETTER "b" FOLLOWING AN ADJUSTMENT PART NUMBER  
INDICATES "RIGHT CHANNEL"

Fig. 36 Pre Amp P.C Board TG-5001A

Fig. 37 Rec Peaking Adjustment Instrument Connection

Fig. 38 Rec Peaking Adjustment

Step	Adjustment Item	Test Tape Supply Signal	Mode	Adjustment Point	Result	Remarks
1	Playback Level	700 Hz 7-1/2 ips 0VU Test Tape	Play	VR 4 50 kB	0 ± 0.5 dBm (0.775V)	
2	VU Meter Sensitivity	700 Hz 7-1/2 ips 0 VU Test Tape	Play	VR 6 5 kB	0VU indication	
3	REC Peaking	19 kHz from an oscillator	REC	VL 2 1.5 mH	Maximum AC Voltmeter indication	Tape Speed 3-3/4 ips. Refer to NOTE 4, 5, 7 and Figs. 36, 37, 38.
4	Recording Level	Scotch #176 Tape 1,000 Hz 0 dBm Recording	REC	VR 3 20 kB	0 ± 0.5 dBm (0.775V)	
5	Frequency Response (3-3/4 ips)	Scotch #176 Tape 1.5 kHz, 15 kHz -20dBm Recording	REC	TC 1 80 P	1.5 kHz 15 kHz flat	Tape Speed 3-3/4 ips. Recheck Recording Level.
6	Distortion Confirmation	Scotch #176 Tape 1,000 Hz 0 dBm Recording	REC		Less than 0.5%	See NOTE 6.
7	PB Amp Bias Filter	100 kHz from an oscillator	REC	VL 3 22 mH	Minimum AC Voltmeter indication	Set Monitor Switch to "TAPE". See NOTE 7, 8.
8	REC Amp Bias Filter	100 kHz from an oscillator	REC	VL 1 22 mH	Minimum AC Voltmeter indication	Set Monitor Switch to "SOURCE". See NOTE 7, 8.

Chart-4

- NOTES:**
1. Output Level Control should be at maximum.
  2. Except for Step 3 and 5, set Tape Speed to 7-1/2 ips.
  3. Set Tape Selector Switch to Low Noise position.
  4. Stop recording bias oscillator while making Rec Peaking Adjustment. (Refer to Fig. 36)
  5. When 19 kHz indicates the peak, check and ensure that the AC voltmeter shows 16 dB of increase when 15 kHz of input is fed rather than when 1 kHz is fed.
  6. If it does not comply with the specifications, repeat Steps 4 and 5, and re-adjust.
  7. Unless the core is moved intentionally this adjustment is not necessary.
  8. Adjust the oscillator's frequency to give a frequency counter reading of 100 kHz.

## X. DC RESISTANCE OF VARIOUS COILS

Part	Designation	DC Resistance
Main Motor	SCM-200	Between BLU-RED : 110 ohms Between YLW-BRN : 170 ohms Pick-up Coil : 665 ohms
Reel Motor	20XO-TD	Between BLU-RED : 30 ohms Between YLW-BRN : 157 ohms
Pinch Roller Plunger	1664PLTI	600 ohms $\pm$ 10%
Brake Plunger	1240PLTI	600 ohms $\pm$ 10%
Pause Plunger	0730FLT	600 ohms $\pm$ 10%
Relay	MY4-02-US-L	650 ohms $\pm$ 15%
Relay	BR211	1,280 ohms $\pm$ 10%
Relay	LAB2NS	1,750 ohms $\pm$ 10%
Relay	321D012	230 ohms $\pm$ 15%
Erase Head	E4-201	1.8 ohms
Recording Head	R4-241	5.9 ohms
Playback Head	P4-251	219 ohms $\pm$ 10%

Resistor and Capacitor which is not listed in this parts list, please refer to COMMON LIST FOR SERVICE PARTS.

## HOW TO USE THIS PARTS LIST

1. This parts list is compiled by various individual blocks based on assembly process.
2. When ordering parts, please describe parts number, serial number, and model number in detail.
3. How to read List

Ref. No.	Parts No.	Description	Schematic No.	Q'ty
<b>FLYWHEEL BLOCK #13</b>				
12-115x	800425	Flywheel Block Assy. Comp.	RDG #13	1
12-116	244506	Flywheel Only	RD-233	1
12-117x	244754	Felt, Flywheel	RD-275	1
12-118	251324	Main Metal Case	RD-236	1
12-119	253080	Main Metal	RD-237	1

4. The symbol numbers shown on the P.C. Board list can be matched with the Composite Views of Components of the Schematic Diagram or Service Manual.
5. Please utilize separate "Common List for Service Parts" for Resistor Parts orders.
6. The shape of the parts and parts name, etc. can be confirmed by comparing them with the parts shown on the Electrical Parts Table of P.C. Board.
7. Both the kind of part and installation position can be determined by the Parts Number. To determine where a parts number is listed, utilize Parts Index at end of Parts List.  
It is necessary first of all to find the Parts Number. This can be accomplished by using the Reference Number listed at right of parts number in the Parts Index. (meaning of ref. no. outlined in Item 3 above).
8. Utilize separate "Price List for Parts" to determine unit price. The most simple method of finding parts Price is to utilize the reference number.

- CAUTION:**
1. When placing an order for parts, be sure to list the parts no., model no., and description. There are instances in which if any of this information is omitted, parts cannot be shipped or the wrong parts will be delivered.
  2. Please be careful not to make a mistake in the parts no. If the parts no. is in error, a part different from the one ordered may be delivered.
  3. Because parts number and parts unit supply in the Preliminary Service Manual (Basic Parts List) may be partially changed, please use this parts list for all future reference.

**WARNING:** **⚠** INDICATES SAFETY CRITICAL COMPONENTS. FOR CONTINUED SAFETY, REPLACE SAFETY CRITICAL COMPONENTS ONLY WITH MANUFACTURER'S RECOMMENDED PARTS.

**AVERTISSEMENT:** **⚠** IL INDIQU LES COMPOSANTS CRITIQUES DE SURETE. POUR MAINTENIR LE DEGRE DE SECURITE DE L'APPAREIL NE REMPLACER LES COMPOSANTS DONT LE FONCTIONNEMENT EST CRITIQUE POUR LA SECURITE QUE PAR DES PIECES RECOMMANDEES PAR LE FABRICANT.

## AC INLET SYSTEM

This model is equipped with an AC INLET SYSTEM. Please refer to the AC INLET SYSTEM CHART below for the specific type. By the AC INLET SYSTEM, AC (mains) cord can be connected to and disconnected from the model because the model is provided with socket exclusively for AC (mains) cord on its main body.

Please note, however, that certain models are not equipped with this system and has a built-in AC (mains) cord as before.

### AC INLET SYSTEM CHART
